Static Laser Light Scattering is an established and precise measurement technique for the particle size characterization of both dry and wet samples. Static light scattering is a phenomenon that occurs when light interacts with particles. It produces characteristic angle-dependent patterns in which light is preferentially scattered by the particles in certain directions. Scattering angle and intensity depend on the size of the particles involved. Therefore, static light scattering can be used to measure particle size distributions when an ensemble of particles is illuminated with a laser beam and the resulting light scattering pattern is recorded over a wide angular range.
