The static triaxial test system is a testing equipment used to investigate the mechanical properties of materials under static (constant) loading conditions. It primarily consists of components such as a loading system, pressure chamber, measurement system, and control system. The testing principle involves applying a static axial load to the test specimen and measuring using displacement sensors, pressure sensors, etc. The loading mode can be either stress-controlled (loading according to a specific stress increment) or strain-controlled (loading at a certain strain rate).
