The stationary demagnetizer is a device used to remove residual magnetism from metal objects, widely applied in industries such as manufacturing, electronics, and precision instruments. It generates an alternating magnetic field that gradually reduces the magnetism on the object, returning it to a non-magnetic state. This device is typically designed as a fixed structure, making it easy to operate and use, capable of handling various shapes and sizes of metal items. The advantages of a stationary demagnetizer include high efficiency, reliability, and low maintenance costs, making it an essential tool for ensuring product quality and accuracy.
