## Abstracts

The global Stationary Emission Control Catalyst market size is expected to reach \$ 2729 million by 2032, rising at a market growth of 2.9% CAGR during the forecast period (2026-2032).

Emission control catalysts are now used on all types of internal combustion engines, as well as in a number of stationary applications. Catalytic reactors for mobile applications, known as catalytic converters, utilize catalyst-coated monolithic substrates. Terms which are used to characterize the catalyst performance include conversion efficiency, light-off temperature, and space velocity.

Following the success in mobile engine applications, catalyst technologies were introduced for stationary applications, for the control of volatile organic compounds (VOC) and NO<sub>x</sub> emissions. The list of catalyst applications covers such emission sources as chemical plants, painting and coating processes, ovens, printing, dry cleaning, power generation, and, last but not least, stationary engines. Examples of catalyst technologies for stationary engines include non-selective catalytic reduction (NSCR) of NO<sub>x</sub> from rich burn natural gas engines and selective catalytic reduction (SCR) of NO<sub>x</sub> by ammonia from diesel engines.

Johnson Matthey, BASF, Cormetech, UOP LLC (Honeywell) and Clariant International AG are the leading suppliers of stationary emission control catalyst in the world. Chinese producers mainly sprang up, Tianhe (Baoding), Hailiang, Guodian Longyuan are the key producers in China now, and most of them got the process from overseas companies. The top ten took up about 55% of the global production market.
