According to our (Global Info Research) latest study, the global Stationary Source Denitration Molecular Sieve market size was valued at US\$ 133 million in 2024 and is forecast to a readjusted size of USD 180 million by 2031 with a CAGR of 4.8% during review period.

Stationary source denitrification molecular sieve is a catalytic material specially used to remove nitrogen oxides (NO_x) from industrial stationary source emissions. This molecular sieve converts NO_x into harmless nitrogen and water through selective catalytic reduction (SCR) or selective non-catalytic reduction (SNCR) technology. Molecular sieves have efficient adsorption and catalytic properties and can complete the denitrification reaction at a lower temperature.
