A steam air humidifier is a device that uses heated water to generate steam and releases the steam into the indoor air to increase air humidity. This type of humidifier usually consists of a water tank, a heating element (such as a heating plate or heating rod), and an air outlet, which turns the water into steam by heating it and releasing the steam into the indoor air. Steam air humidifiers have a simple working principle, are easy to operate, and can quickly increase the humidity level of indoor air. Because steam is hot, when it is released into the indoor air, it increases the temperature of the air, which also helps to increase the feeling of warmth in the room. Steam air humidifiers are suitable for dry climates or environments that need to increase indoor humidity, such as dry air after heating in winter, dry climate areas or places that need to maintain a specific humidity level. However, it should be noted that regular cleaning and maintenance are required during use to avoid bacterial growth and health effects.
