Steam flow regulation valve is a valve specially used to control steam flow. It is usually installed in the steam pipeline system to adjust and control the flow of steam to meet the requirements of the process. It usually consists of an actuator (such as an electric actuator, a pneumatic actuator) and a valve body. The flow area is changed by adjusting the position of the valve core to achieve the purpose of controlling the steam flow. This type of valve plays a key role in industrial heating, heating, power generation and other applications that require precise control of steam flow.
