Abstracts

Steam Tube Dryer is an indirect heating chamber that contains numerous heat transfer tubes. Through the rotary joint, the energy source (steam) is lead into the manifold, then into numerous heat transfer tubes inside the rotating cylinder (chamber) body. The drying object is introduced to the body by screw type conveyor, and is dried by touching the steam heated tube surfaces. The vapor generated from the drying object is exhausted outside by the carrier gas. The drying is controlled by the steam temperature (pressure) and the duration of time inside the body.
