According to our (Global Info Research) latest study, the global Steam Turbines for Nuclear Power Plant market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Steam turbine is a device that converts the thermal energy of steam into mechanical energy, which can then be used to drive a generator and produce electricity. In the context of nuclear power plants, steam turbines are used to convert the heat energy generated by a nuclear reactor into electrical energy. Steam from the reactor is directed into the turbine, where its high pressure and temperature act on the turbine blades, causing them to rotate. The rotation of the turbine is then transferred to a generator, which converts the mechanical energy into electrical energy. Steam turbines are a crucial component of nuclear power plants as they provide a highly efficient and reliable means of generating electricity from the nuclear heat source.
