According to our (Global Info Research) latest study, the global Steel Antenna market size was valued at US\$ 485 million in 2024 and is forecast to a readjusted size of USD 665 million by 2031 with a CAGR of 5.1% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Steel sheet antenna (also known as metal stamping antenna or sheet metal antenna) is a metal structure antenna made of cold-rolled steel sheet, stainless steel or galvanized steel through stamping, bending, welding and other processes. Its core features are high strength, corrosion resistance, and excellent environmental adaptability. It uses the conductive properties of the metal sheet itself to achieve electromagnetic wave radiation and reception. It is commonly used in low-frequency bands (such as UHF, VHF) or high-power scenarios. Typical designs include monopole, dipole or curved surface reflection structure. Compared with PCB printed antennas or ceramic antennas, steel sheet antennas are more suitable for harsh environments (high temperature, high humidity, mechanical shock), but they are larger in size and are often used in vehicle-mounted communications, industrial equipment and outdoor base stations.
