The global Steel Rectangular Tubing market size is expected to reach \$ 110795 million by 2032, rising at a market growth of 4.0% CAGR during the forecast period (2026-2032).

Steel Rectangular Tubing is a structural steel product formed by cold- or hot-forming flat steel into a closed rectangular profile, offering high strength-to-weight efficiency, uniform load distribution, and excellent torsional rigidity for use in construction, machinery, transportation, racking systems, furniture, and infrastructure. Its supply chain begins upstream with iron ore mining and steelmaking (blast furnace or electric arc furnace) to produce slabs or coils, followed by hot-rolling into strip or plate, which is then slit and formed by tube mills through roll-forming and high-frequency welding into rectangular sections, sized, straightened, heat-treated if required, and cut to length; downstream stages include surface treatment (pickling, painting, galvanizing, or powder coating), warehousing, and distribution through steel service centers and regional distributors to fabricators and OEMs in building, automotive, agricultural, and industrial equipment sectors, where it is cut, welded, drilled, and assembled into end products. In 2025, global Steel Rectangular Tubing production is estimated at approximately 92 million tons, supported by an installed worldwide capacity of about 110 million tons; the market operates at an average unit price ranging from roughly USD 780 to 1,250 per ton, while leading manufacturers typically achieve gross margins in the range of 18%.
