## Abstracts

According to our (Global Info Research) latest study, the global Steelmaking Slag market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Steelmaking slag is the general term for the product formed by the physical and chemical reaction between the impurities in the metal materials (molten iron and scrap steel, etc.) oxidized by oxidants and the oxides generated by the slag-forming agent and the furnace lining. The density of slag is lower than that of molten steel and it usually covers the surface of molten steel. The main task of steelmaking is to remove harmful impurities (sulfur, phosphorus, gas and inclusions, etc.) in molten steel to the maximum extent, which mainly relies on the refining effect of slag. Therefore, the composition and temperature of slag must be constantly controlled and adjusted during the smelting process.
