Abstracts

The global Stem Cell Research Antibodies market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Stem cells are unspecialized cells that have the ability to self-renew and differentiate into specialized cell types, such as neurons, liver or muscle cells. Embryonic stem cells (ESCs) and induced pluripotent stem cells (iPSCs) are pluripotent stem cells (PSCs) that can divide for long periods of time in culture. They have the potential to differentiate and become any cell type found in the human body. Adult stem cells such as neural stem cells (NSC), mesenchymal stem cells (MSC) and hematopoietic stem cells (HSC) are pluripotent stem cells. The differentiation of pluripotent stem cells is limited to the cell types found in the tissue of origin. These cells help maintain and repair the tissue in which they reside.

Stem cells have shown great potential in the fields of developmental biology, disease model research, drug development and screening, and cell therapy research. Antibody-based detection methods, such as immunocytochemistry and flow cytometry, are commonly used to characterize various stem cells and their differentiated cells. The use of high-quality antibodies is one of the key factors for the success and rapid progress of stem cell research.

In stem cell research, scientists often need to use specific antibodies to label, detect and isolate stem cells in order to study their biological properties, differentiation potential and application potential. Stem Cell Research Antibodies can usually identify and detect specific proteins such as stem cell surface markers, internal cytokines, and transcription factors.
