A binocular RGB-D camera is a camera that combines RGB (color) and depth information. It uses binocular vision technology to obtain stereo images and can simultaneously capture color and depth images of a scene. The camera uses two cameras to shoot the same scene from different angles, and obtains depth information through parallax calculation, thereby realizing the perception of three-dimensional space. It is widely used in robot vision, virtual reality, augmented reality, object recognition, autonomous driving and other fields, providing more accurate three-dimensional data and scene perception capabilities.
