According to our (Global Info Research) latest study, the global Stereotaxic Radiosurgery Gamma Knife market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Stereotactic radiosurgery involves delivering highly focused beams of radiation to specific targets within the brain. It is a non-surgical procedure that does not involve incisions or tissue removal. Gamma Knife is a specialized device used for stereotactic radiosurgery. It consists of a helmet-like device that houses up to 192 small cobalt-60 radiation sources. These sources emit gamma rays that converge at targeted points within the brain, delivering precise, concentrated doses of radiation. Gamma Knife stereotactic radiosurgery is commonly used to treat benign and malignant brain tumors, arteriovenous malformations (AVMs), trigeminal neuralgia, and other neurological conditions.
