The global Stereotaxic Radiosurgery Gamma Knife market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Stereotactic radiosurgery involves delivering highly focused beams of radiation to specific targets within the brain. It is a non-surgical procedure that does not involve incisions or tissue removal. Gamma Knife is a specialized device used for stereotactic radiosurgery. It consists of a helmet-like device that houses up to 192 small cobalt-60 radiation sources. These sources emit gamma rays that converge at targeted points within the brain, delivering precise, concentrated doses of radiation. Gamma Knife stereotactic radiosurgery is commonly used to treat benign and malignant brain tumors, arteriovenous malformations (AVMs), trigeminal neuralgia, and other neurological conditions.

This report studies the global Stereotaxic Radiosurgery Gamma Knife production, demand, key manufacturers, and key regions.
