## Abstracts

According to our (Global Info Research) latest study, the global Stock Market API market size was valued at US\$ 1458 million in 2025 and is forecast to a readjusted size of US\$ 2091 million by 2032 with a CAGR of 5.3% during review period.

To address the inefficiencies of manual data collection, information delays, and cumbersome trading decision-making processes, stock market data APIs (Application Programming Interfaces) have emerged. Since the rapid development of financial technology and electronic trading in the early 21st century, this data service field has undergone revolutionary progress. Currently, stock market APIs have evolved into a multi-functional, high-frequency service collection encompassing real-time quotes, historical data, fundamental information, quantitative analysis, and algorithmic trading access. They are widely used in individual investor terminals, financial institution systems, quantitative hedge funds, financial media, and academic research, providing efficient, accurate, and structured market data streams. This significantly improves investment research efficiency, strategy execution speed, and the intelligence level of decision-making, becoming a core digital infrastructure connecting the market and participants, and driving modern financial innovation and efficiency.

Stock market APIs are transforming from single data interfaces into core digital infrastructure for quantitative investment. Through innovation in three areas—low-latency transmission, AI-powered analysis, and ecosystem collaboration—institutions can achieve the three-pronged goal of 'more accurate trading signals + more efficient strategy execution + stronger risk control capabilities.' Driven by both digital transformation and regulatory technology, companies with independently controllable API technology will build core competitiveness in quantitative investment and lead a new era of high-quality development in financial technology.
