Remote surveying and geological mapping for mines and quarries is increasingly being done using LIDAR and UAV as it offers fast accurate data to plan mining processes. LIDAR which stands for light detection and ranging is a remote sensing method that uses light in the form of a pulsed laser to measure ranges (variable distances). LIDAR is used for surveying the mining area and helps in determining ore body mining pit volume and pre-strip and spoil surface volumes. UAVs which stands for unmanned aerial vehicle or drone is a type of aircraft that operates without a human pilot onboard. The recent improvements in technology have resulted in the development of UAVs for multiple purposes. In mining UAVs are used for aerial photography remote sensing and searching monitoring and providing information from hazardous locations.
