## Abstracts

The global Straight Beam Dual Element Probe market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A Straight Beam Dual Element Probe is a type of ultrasonic transducer used in non-destructive testing (NDT) applications. It consists of two separate elements, typically piezoelectric crystals, mounted side by side in a straight line. This type of probe is designed to generate and receive ultrasonic waves in a straight beam configuration. One element is used to generate the ultrasonic wave, while the other element is used to receive the reflected wave from the test material. The use of two elements allows for improved sensitivity and accuracy in detecting defects or discontinuities within the material being tested.
