In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

A stratospheric airship is an airship that can fly in the stratosphere. It mainly relies on air buoyancy to rise and can fly for a long time in a quasi-stationary state at this altitude. As a type of near-space aircraft, stratospheric airships have unique flight characteristics and application prospects. Stratospheric airships fly in the stratosphere 20km to 100km above the ground. This altitude range belongs to near-space and has the characteristics of relatively stable airflow, low atmospheric density, low ambient temperature, and small flight Reynolds number. Stratospheric airships can maintain a quasi-stationary state in the stratosphere for a long time, which has significant advantages for long-term communication support, intelligence collection, electronic suppression, early warning and other tasks. Stratospheric airships can carry a certain scale of payload, which makes it more flexible and adaptable when performing various tasks.
