Abstracts

According to our (Global Info Research) latest study, the global Strawberry Grow Light market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Strawberry is a light-loving plant. If there is insufficient light for a long time, the leaves will turn yellow; there will be few or no flowers; the fruit will be small and sour, and the coloring and ripening will be slow; the surface of the fruit will be light red or white, and the appearance will deteriorate; Increased malformed fruit.

Therefore, the use of artificial light sources to supplement light for strawberries can effectively solve the above-mentioned problems caused by insufficient sunlight. At the same time, scientific research practice has proved that reasonable use of artificial light sources to supplement light can promote growth, shorten the cycle, promote flowering and fruiting, increase production and weight, increase color and sweetness, and improve taste and other benefits!

The effective wavelength of plant photosynthesis is between 400-700nm, among which the blue light of 425-460nm and the red light of 640-660nm contribute the most to photosynthesis, while the green light of 520-610nm has a low rate of absorption by plants. It can be seen that not all light contributes to the photosynthesis of plants.

The light required for strawberry seedlings is mainly blue light of 425-460nm. In the flowering and fruit-promoting stage of strawberries, the light required is mainly red light of 640-660nm. Production of special fill light for strawberries, which can provide

scientific fill light for strawberries and meet the needs of strawberry growth.
