## Abstracts

According to our (Global Info Research) latest study, the global Strengthened Ultra-Thin Glass for Foldable Displays market size was valued at US\$ 661 million in 2025 and is forecast to a readjusted size of US\$ 1883 million by 2032 with a CAGR of 12.9% during review period.

Strengthened ultra-thin glass for foldable displays refers to ultra-thin glass materials and processed cover-window products used in foldable smartphones, foldable tablets, foldable notebooks, flexible automotive displays and other bendable display devices. The product is typically based on aluminosilicate or borosilicate ultra-thin glass and is manufactured through precision forming, thinning, cutting, edge finishing, chemical strengthening, surface cleaning, pre-lamination treatment and reliability testing. It is designed to retain the optical and surface advantages of glass, including high light transmittance, low haze, scratch resistance, dimensional stability and barrier performance, while also delivering repeated bending durability at a thickness of only several tens of micrometers. The main product forms include UTG mother glass, chemically strengthened UTG, foldable cover glass, UTG composite cover windows and pre-processed glass sheets for display module lamination. Key technical parameters usually include thickness, bending radius, surface compressive stress, depth of compression layer, edge defect control, light transmittance, haze, warpage and folding-cycle reliability. Its core function is to provide a protective cover layer above flexible OLED display structures, combining a premium glass touch feel with improved bending reliability, impact resistance, crack control and display clarity. This product category is mainly used in inner display cover windows of book-type and clamshell foldable devices, and is gradually extending to larger flexible display formats. In 2025, the global industry average price of strengthened ultra-thin glass for foldable displays was about

USD 2,050 per square meter, and the industry average gross margin was about 32%.

Strengthened ultra-thin glass for foldable displays is essentially a material upgrade within the flexible display value chain. It replaces early plastic-based protection layers with a glass-based cover-window solution that offers better touch feel, optical clarity, scratch resistance and long-term reliability. The upstream chain includes high-purity glass raw materials, aluminosilicate and borosilicate formulations, melting and forming equipment, chemical strengthening salts, precision thinning consumables and laser processing materials. The midstream chain covers UTG mother glass, thinning, cutting, edge finishing, chemical strengthening, composite lamination and reliability testing. The downstream chain is led by foldable smartphones, while foldable tablets, notebooks, automotive flexible displays and larger bendable screens are still in the early adoption stage. As foldable devices move from niche flagship products to more stable premium product lines, the core value of UTG is no longer limited to bendability. The product must also balance crease reduction, impact resistance, scratch resistance, optical quality, production yield and cost control.

Competition in this industry is shifting from a highly concentrated material supply model to a more layered structure involving glass substrate makers, back-end processors, display module companies and domestic replacement suppliers. In the early stage, the key barriers were ultra-thin glass forming, chemical strengthening uniformity and edge crack control. The next phase of competition will be more closely tied to customer qualification, mass-production yield, terminal design adaptation and the ability to deliver composite cover-window solutions. Korean supply chains have strong advantages in foldable OLED module integration, Japanese and European companies remain strong in high-end glass materials, and Chinese manufacturers are expanding through new capacity, production ramp-up, customer introduction and capital investment. Because qualification cycles are long and reliability risks are high, the market is unlikely to become fully fragmented in the short term. However, additional supply will gradually reduce unit prices and pressure weaker participants.

The policy and demand environment remains supportive. Consumer electronics has entered a replacement-driven cycle, and foldable displays, tri-fold designs, thinner form factors and larger flexible screens are becoming important tools for terminal brands to differentiate high-end products. On the supply side, advanced display materials, electronic glass, precision manufacturing and domestic substitution policies continue to support investment in the UTG value chain. Future growth will not only come from higher foldable smartphone shipments, but also from larger display areas, more

complex folding structures, stronger cover-window requirements and the gradual adoption of flexible displays beyond smartphones. At the same time, the industry still faces substitution risks from CPI films, composite cover materials, flexible hard coatings and new display architectures. The companies most likely to benefit over the long term will be those with stable mass production, low-defect processing, fast customer qualification and cross-process integration capabilities.
