Abstracts

In order to study the stress and deformation of a certain material in a specific state, the stress and strain of the material are measured by instrument testing, which provides reliable data for structural design, stress checking or prediction of material failure

According to our (Global Info Research) latest study, the global Stress and Strain Testers market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

There are two main stress-strain test methods, contact and non-contact. The sensor test represents the contact measurement method. In this method, strain gauges need to be arranged before the test, and the wires will be routed. Balanced by the Wheatstone bridge module, it can be converted into a corresponding voltage signal. After passing through the analog/digital circuit inside the tester, the voltage signal can be converted into a digital signal, and then the special software can be used to capture and Analyze these signals. There is also an optical strain measurement system, which is a non-contact measurement method. The measurement process is relatively simple, and the test process data can be viewed repeatedly.
