The striking wheel balance weight is a weight component installed on the wheel of the vehicle. Before the wheel is installed, it needs to be tested for dynamic balance by a special equipment - a wheel dynamic balance machine. After the test, appropriate weights, namely wheel balance weights, are added to the parts where the wheel mass is smaller, so that the wheel can maintain dynamic balance under high-speed rotation. When choosing a striking balance weight, the size, weight and required balancing effect of the wheel should be considered. At the same time, it is necessary to ensure that the material, weight and shape of the selected balance weight meet the requirements of the wheel to ensure that it can effectively play a balancing role.
