According to our (Global Info Research) latest study, the global String-wound Sediment Filter market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

String-wound sediment filters are a variation of melt-blown filters. They are comprised of tightly wound cotton, polyester, or polypropylene string. This string is wrapped firmly around a core, creating a graded density that will trap particulate matter. As water travels through the layers of string, finer and finer particulate matter is removed. However, once string-wound filters become overloaded with sediment, the strings can begin to loosen and shift. This can allow debris back into the water and is an indication it is time for a filter replacement.
