Structural heart disease intervention devices are medical devices used to treat heart diseases by repairing or replacing diseased or defective heart tissues or structures through minimally invasive procedures. Common types of structural heart disease intervention devices include:

Atrial septal defect closure devices: used to treat congenital heart defects by inserting a device into the heart through a catheter and placing a closure device over the defect to prevent blood from flowing from the left atrium to the right atrium.

Mitral valve repair devices: used to treat mitral valve regurgitation or prolapse by inserting a device into the heart through a catheter and placing a repair device over the damaged or prolapsed valve.

Transcatheter aortic valve replacement devices: used to treat aortic valve stenosis or regurgitation by inserting an artificial valve into the heart through a catheter and replacing the damaged aortic valve.

Cerebral aneurysm coiling devices: used to treat cerebral aneurysms or narrowing of the blood vessels in the brain by inserting a coil into the blood vessel through a catheter

to strengthen the blood vessel and prevent blood from leaking out.

These structural heart disease intervention devices have been widely used in clinical practice and have achieved good treatment results, significantly improving the cardiovascular function of patients and enhancing their quality of life.
