According to our (Global Info Research) latest study, the global Structured Light 3D Camera market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Structured Light 3D Camera is a 3D scanning device that uses projected light patterns and a camera system to measure the three-dimensional shape of objects. Structured light scanning is a 3D scanning technology that uses a single light source to project multiple lines on an object, all of which are tracked simultaneously by a camera or multiple cameras. This is in contrast to laser scanners, which fire multiple laser spots one after the other on an object. Like other types of scanning technology, structured light scanning uses one or more cameras located closer to the light source. The role of the camera is to capture the pattern of light cast onto the surface of the object being scanned: the camera lens will see deformed sets of lines (stretched, widened, bent, moved closer or farther apart, etc.) depending on the shape of the object's surface. Through a series of calculations, the scanner uses the deformed light to work out the position, size and shape of the object being scanned.
