The global Student Health Records Software market size is expected to reach \$ 754 million by 2032, rising at a market growth of 4.6% CAGR during the forecast period (2026-2032).

Student health record software is an application used to record and manage student health information. This software typically includes students' personal information, health records, vaccination records, health examination results, medical conditions and more. Through student health record software, schools and parents can easily view students' health information, detect and deal with health problems in a timely manner, and ensure the health and safety of students. At the same time, student health record software can also help schools conduct health management and statistical analysis to provide better health services for students.

Student health record software is currently experiencing rapid growth, with its core objective being the centralized, standardized, and secure management of campus health data. These platforms typically integrate physical examination data, vaccination records, health records, vital sign monitoring, and emergency contact information, supporting collaborative management by school health departments, teachers, and parents, as well as seamless integration with campus information systems. With the advancement of digital campus construction, strengthened data privacy regulations, and increased awareness of health management post-pandemic, market competition is trending towards providing stronger data analysis, early warning capabilities, mobile access, and intelligent health management tools to help improve the efficiency and accuracy of student health monitoring, early intervention, and campus public health response.
