## Abstracts

The global Styrene Acrylic Copolymer Emulsion market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

In recent years, with the development of China's construction industry, water-based architectural coatings have developed rapidly. Styrene-acrylate copolymer emulsion styrene-acrylic emulsion is widely used as a film-forming substance for water-based architectural coatings due to its good material properties, excellent water resistance, weather resistance and durability, and high bonding strength.

Styrene acrylic copolymer emulsion is obtained by emulsion copolymerization of styrene and acrylate monomers, and is a low-viscosity dispersion. It has excellent water resistance, alkali resistance and pigment binding ability. The dispersion is therefore particularly suitable as a binder for highly pigmented interior and exterior paints on stone surfaces. Styrene acrylic copolymer emulsion is an aqueous dispersion emulsion of styrene acrylic copolymer. It is a surfactant stabilized colloid-free emulsion with excellent pigment loading characteristics, alkali resistance and good binding ability to maintain textured aggregates.

Both interior and exterior paints use styrene-acrylic copolymer as a binder because of its excellent pigment-binding properties. Styrene Acrylate Copolymer provides perfect gloss, film strength, durability and chemical resistance. Acrylic styrene emulsion based coatings have high UV stability as well as water and alkali resistance. They are very durable. The addition of styrene to styrene-acrylic copolymers reduces the water absorption and flexibility of the film. This type of coating requires relatively little maintenance due to its low staining tendency and excellent film flexibility and durability.
