Abstracts

The global Styrene-Maleic Anhydride Copolymer market size is expected to reach $ 870 million by 2032, rising at a market growth of 10.4% CAGR during the forecast period (2026-2032).

Styrene-maleic anhydride copolymer (SMA) is a reactive functional polymer formed from styrene and maleic anhydride. Monomer ratio, molecular weight and downstream hydrolysis, esterification or imidization can tune heat resistance, compatibility, dispersion and adhesion for engineering plastics, coatings and inks, adhesives, paper and construction materials. In 2025, global Styrene-Maleic Anhydride Copolymer production reached approximately 62 K metric tons.

Automotive, appliance and electronics applications are adopting heat-resistant lightweight plastics, supporting SMA as a heat modifier and polymer compatibilizer. Higher recycled-plastic content also increases the need for reactive compatibilization.

Waterborne coatings, inks and adhesives require lower volatile-organic content, pigment dispersion and substrate adhesion, driving low-molecular-weight SMA resins and salt solutions. Acid value, molecular-weight distribution and color stability are key purchasing parameters.

Supply is concentrated and customer formulation qualifications are lengthy, creating barriers around reliable production and application support. Chinese suppliers are expanding medium- and high-molecular-weight customized grades, increasing price and delivery competition with imported products.
