Submarine Fender is a protective device specially designed to protect submarines and underwater facilities from impact and friction damage. It is usually installed at the berthing position of submarines or on offshore floating platforms, offshore oil drilling platforms, docks and other structures. The design of submarine fenders needs to withstand the huge impact force generated by submarines during berthing, while ensuring that the collision force between ships and structures can be effectively reduced. Common fender materials include rubber, polyurethane and composite materials, which can provide excellent elasticity and durability.
