## Abstracts

The global Subway Platform Edge Doors market size is expected to reach \$ 1550 million by 2032, rising at a market growth of 8.3% CAGR during the forecast period (2026-2032).

Subway platform edge doors (PEDs) are safety barriers installed at subway stations to separate passengers from the train tracks. These doors align with the train doors, opening and closing simultaneously to provide a safe and controlled environment for passengers. PEDs are designed to enhance passenger safety by preventing accidental falls onto the tracks, reduce the risk of unauthorized track access, and improve station climate control by creating a barrier between the platform and the train. The integration of these doors into modern subway systems is also aimed at improving the operational efficiency of stations by managing crowd control and streamlining train boarding processes.

These doors are particularly important in urban transit systems where safety and efficiency are top priorities. In addition to their safety function, platform edge doors help reduce energy consumption by maintaining the temperature inside the station and improving air quality. Furthermore, PEDs can play a role in increasing the overall reliability and punctuality of subway services by minimizing disruptions caused by accidents or other incidents on the tracks. Their use is growing globally, especially in new and upgraded subway lines, as cities continue to prioritize passenger safety and station modernization.

In 2025, global Subway Platform Edge Doors production reached approximately 52.88 k units, with an average global market price of around US\$ 16510 per unit. And global Subway Platform Edge Doors production capacity reached approximately 62 k units. The average gross margin in this industry reached 27.22%.

Asia-Pacific region also has the highest market share of Subway Platform Edge Doors. Countries such as China, India, Japan, and South Korea have the top ten subway

mileage and stations globally, and their development is continuing at a rapid pace. In recent years, densely populated developing countries such as China, India and Southeast Asia have witnessed rapid growth in subway systems, with increasing mileage. The Subway Platform Edge Doors market has also seen rapid development. Meanwhile, in regions such as Europe and North America, although the development speed of new lines is relatively slow, due to the earlier development of subways, there are no passenger protection devices at the platforms. The subway platform edge doors have also developed to some extent in these areas.

Technologically, the industry is evolving from simple physical barriers into intelligent subsystems. The integration of Internet of Things (IoT) sensors, AI-powered visual analytics, and digital twin technology is becoming a key trend. These advancements enable predictive maintenance, real-time obstacle detection, and optimized system performance. Product-wise, while semi-height doors are common, full-height, fully enclosed platform screen doors are gaining preference in new installations for their superior safety and environmental control. Furthermore, innovations in lightweight composite materials and energy-regenerative systems (which capture kinetic energy from door operations) are emerging to improve sustainability and lifecycle costs.
