According to our (Global Info Research) latest study, the global Suction Anchor market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A suction anchor is a type of anchoring system used primarily in offshore engineering to secure floating structures like oil rigs, wind turbines, and pipelines to the seabed. It consists of a large, hollow steel cylinder that is driven into the seabed and then pumped out to create a vacuum, which generates strong suction forces to hold it firmly in place. This method provides high load capacity and stability, making suction anchors suitable for deep-water applications and varying seabed conditions. Their installation is relatively quick and causes minimal environmental disturbance compared to traditional anchoring methods.
