According to our (Global Info Research) latest study, the global Suction Caissons market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A suction caisson is a type of large, cylindrical anchoring device used in offshore engineering to secure structures like oil platforms, wind turbines, and subsea installations to the seabed. It operates by being lowered into the seabed, after which the water inside is pumped out to create a vacuum, generating strong suction forces that anchor it firmly. This method provides significant holding power and is effective in various seabed conditions, including soft sediments and deep water. Suction caissons are valued for their ease of installation, minimal environmental impact, and ability to be installed and removed with precision.
