According to our (Global Info Research) latest study, the global Suction Header Clarifier market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Suction header clarifier, also known as a suction header sedimentation tank or clarifier, is a type of equipment used in water or wastewater treatment processes to remove suspended solids and precipitates from the liquid. It consists of a tank with a system of collection headers positioned at the bottom. The headers are fitted with suction or vacuum pipes that create a negative pressure to draw settled solids and sediment towards the collection system.

As water or wastewater flows into the clarifier, solids settle to the bottom due to gravity, forming a sludge layer. The suction headers then remove the settled solids by directing the suction pipes over the sludge layer, pulling the solids into the collection system. The clarified liquid is then collected and discharged from the top of the tank. Suction header clarifiers are commonly used in applications where efficient sedimentation and clarification are required, such as in municipal water treatment plants or industrial wastewater treatment processes.
