Abstracts

A suction lysimeter is an instrument used to measure soil moisture mobility. It evaluates the soil's permeability and water conductivity by creating negative pressure (sucking) in the soil, allowing water to move from the soil into the instrument, and then measuring the flow, or rate at which the water comes out. This instrument is usually used for the study of soil moisture properties to help understand the dynamic changes of moisture in the soil and the moisture transport characteristics of the soil.

According to our (Global Info Research) latest study, the global Suction Lysimeter market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.

The suction lysimeter is a special device used to measure hydrological processes such as soil water evaporation and plant transpiration. It provides important data support for research in agriculture, ecology, environmental science and other fields by simulating soil moisture conditions under natural conditions. As global climate change and water shortage problems become increasingly severe, the application demand for suction lysimeters in related fields continues to grow, and the market prospects are broad.

As the understanding of the importance of soil moisture management continues to deepen, suction lysimeters are expected to be used in more fields in the future. For example, in the field of urban planning, this equipment can be used to evaluate the ecological benefits and water cycle process of urban green spaces; in the field of water conservancy engineering, it can be used to monitor the evaporation of water bodies such as reservoirs and lakes.
