## Abstracts

The global Sulfide Stress Cracking Services market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Sulfide stress cracking (SSC) is a type of corrosion-induced failure mechanism that can occur in metals and alloys under high-stress conditions in the presence of hydrogen sulfide (H<sub>2</sub>S) gas, which is commonly found in oil and gas production environments. SSC occurs when the metal is exposed to H<sub>2</sub>S and simultaneously subjected to tensile stresses. This combination can lead to the formation and propagation of cracks that can ultimately lead to catastrophic failure. SSC is a serious concern for the oil and gas industry, where pipelines, well casings, and other critical components are exposed to H<sub>2</sub>S and high-stress conditions.

Sulfide Stress Cracking (SSC) testing services are designed to evaluate the susceptibility of metals and alloys to SSC by subjecting them to controlled laboratory conditions that simulate the high-stress, H<sub>2</sub>S-containing environment encountered in oil and gas production. These tests typically involve exposing metal specimens to a H<sub>2</sub>S-containing solution under applied tensile stress, and monitoring the specimens for the formation and propagation of cracks. The results of SSC testing can be used to select appropriate materials and coatings for oil and gas production equipment, and to develop appropriate maintenance and inspection programs to prevent SSC-related failures.
