Abstracts

According to our (Global Info Research) latest study, the global Sulfonylurea Hypoglycemic Drugs market size was valued at US\$ 21610 million in 2024 and is forecast to a readjusted size of USD 27160 million by 2031 with a CAGR of 3.3% during review period.

Sulfonylurea hypoglycemic drugs are commonly used in clinical oral hypoglycemic drugs, mainly used to treat type 2 diabetes. These drugs stimulate insulin secretion by specifically binding to sulfonylurea receptors on the pancreatic beta cell membrane, thereby achieving the effect of lowering blood sugar. The sulfonylurea group (-SO₂NHCONH-) is the key structure for its hypoglycemic effect. This type of medication can be divided into three generations. The first generation includes tolbutamide and chlorpropamide, which have relatively high molecular weights and low specificity for receptor binding. They require large doses and are now less commonly used. The second generation includes glibenclamide, glipizide, gliclazide, and gliquidone. Compared with the first generation, the second generation drugs have smaller molecular weights, higher receptor binding specificity, require smaller doses, have stronger hypoglycemic effects, and relatively fewer adverse reactions. The third generation, represented by glimepiride, has further optimized molecular structure, higher receptor selectivity, longer drug action time, and relatively reduced risk of hypoglycemia.
