Abstracts

According to our (Global Info Research) latest study, the global Sulfur-containing Acrylate market size was valued at US\$ 70.48 million in 2025 and is forecast to a readjusted size of US\$ 117 million by 2032 with a CAGR of 7.5% during review period.

Sulfur-containing acrylate and methacrylate monomers are functional polymerizable monomers that contain both organosulfur groups and acrylate or methacrylate double bonds. The sulfur-containing motifs may include thioethers, disulfides, aryl sulfides, thianthrene, diphenyl sulfide, thioesters or other sulfur-bridged structures. These monomers are incorporated into polymer networks through radical polymerization, UV/EB curing, copolymerization or controlled polymerization to provide high refractive index, redox responsiveness, self-healing behavior, dynamic crosslinking, strong polarizability, adhesion enhancement or optical-property tuning.

Based on our research, sulfur-containing acrylates should be treated as a family of functional monomers rather than as a single CAS product. Their value comes from the combination of organosulfur motifs and acrylate or methacrylate polymerizable double bonds. Thioether, disulfide, aryl sulfide and thianthrene structures can increase molar refraction, improve polarizability, introduce dynamic bond exchange or provide redox-responsive behavior, while acrylate and methacrylate groups enable UV curing, radical polymerization, copolymerization and crosslinked network formation.

From the supply perspective, the market remains niche and project-driven, with only a limited number of publicly documented single-product suppliers. BLD is the strongest China-based core supplier candidate based on product-page evidence, while Dakenchem provides product, assay, capacity and packaging information for

2-(phenylthio)ethyl acrylate and can be treated as a production/supply candidate. Sigma-Aldrich, Alfa Chemistry, SynQuest, BOC Sciences and Ambeed have clear product or channel evidence, but they should generally be treated as confirmed suppliers rather than confirmed manufacturers.

Demand is driven by high-refractive-index optical materials, UV/EB-curable coatings, optical films, redox-responsive polymers, self-healing materials, functional copolymers, biomedical hydrogels and electronic display materials. Aromatic thioether acrylates are more relevant to refractive-index enhancement and optical thin films. Disulfide dimethacrylates are more relevant to dynamic crosslinking, self-healing and redox-responsive networks. Thianthrene and polycyclic sulfur-containing diacrylates are more research-oriented and high-end optical-material candidates. Future growth should come from display optical films, high-index transparent materials, redox-responsive materials, recyclable or self-healing polymers and custom functional monomer development.
