Abstracts

The global Sulfuric Acid Recycling Services market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The sulfuric acid recycling system refers to a set of systems that recycle and reuse sulfuric acid in industrial wastewater. In some industrial processes, a large amount of wastewater containing sulfuric acid is produced. Direct discharge of such wastewater will cause serious environmental pollution and waste of resources. Therefore, through the sulfuric acid recycling system, the sulfuric acid in these wastewater can be recovered and reused to reduce environmental pollution and production costs.

The sulfuric acid recycling system generally includes several stages such as wastewater treatment, concentration, evaporation, and crystallization. In the wastewater treatment stage, physical and chemical treatments need to be applied to remove suspended solids and impurities from the wastewater containing sulfuric acid. After obtaining high-purity sulfuric acid waste liquid, the sulfuric acid is concentrated to a certain concentration by methods such as concentration and evaporation, and then purified by crystallization, finally obtaining the reusable sulfuric acid product.

The sulfuric acid recycling system can effectively solve the problem of environmental pollution caused by sulfuric acid wastewater and is also an effective means of saving resources and reducing production costs. In some industries, such as electroplating, textiles, leather, etc., sulfuric acid recycling systems have been widely used.
