According to our (Global Info Research) latest study, the global Super-Luminescent Diode Light Source market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

A Super-Luminescent Diode (SLD) light source is a type of semiconductor device that emits broad-spectrum light with high optical power. It combines the characteristics of a light-emitting diode (LED) and a laser diode (LD) to produce a unique type of light source.An SLD operates based on the principle of amplified spontaneous emission (ASE). Unlike a laser diode that produces coherent light through stimulated emission, an SLD generates incoherent light through spontaneous emission. However, the emitted light in an SLD is amplified within the device to achieve high output power.The spectral output of an SLD is broad, spanning a wide range of wavelengths, typically several tens of nanometers. This broad spectrum is advantageous in applications such as optical coherence tomography (OCT) and fiber optic sensing, where a wide bandwidth of light is required for high-resolution imaging or sensing.Compared to traditional light sources like LEDs, SLDs offer higher optical power, enabling longer detection ranges and better signal-to-noise ratios. They also exhibit a smaller spectral linewidth, which improves the resolution and fidelity of measurements in various optical systems.
