A super pressure balloon is a specially designed balloon that always maintains a positive pressure difference with the outside environment. A super pressure balloon is a balloon that always maintains a positive pressure with the outside environment during its high altitude flight. This type of balloon is usually designed for high altitude scientific exploration and observation missions. The working principle of a super pressure balloon is mainly based on the pressure difference between its internal and external environment. After the balloon is filled with pressurized helium, the balloon can remain inflated and float in the air because the internal pressure is greater than the external atmospheric pressure. As the altitude increases, the external atmospheric pressure gradually decreases, but the pressure inside the balloon remains unchanged (or slightly decreases, but is always greater than the external pressure), so the balloon can fly stably at high altitudes.
