Abstracts

According to our (Global Info Research) latest study, the global Supercapacitor Separator Paper market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The separator paper of the supercapacitor is located between the two porous carbon electrodes, and is completely soaked in the electrolyte together with the electrodes, which plays a role of isolation during repeated charge and discharge, prevents electron conduction, and prevents internal short circuit caused by contact between the two electrodes. This requires that the separator paper is an electronic insulator with good isolation performance, and its pores should be as small as possible smaller than the minimum particle size of the electrode surface active material.
