Abstracts

The global Supercapacitor Separator Paper market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The separator paper of the supercapacitor is located between the two porous carbon electrodes, and is completely soaked in the electrolyte together with the electrodes, which plays a role of isolation during repeated charge and discharge, prevents electron conduction, and prevents internal short circuit caused by contact between the two electrodes. This requires that the separator paper is an electronic insulator with good isolation performance, and its pores should be as small as possible smaller than the minimum particle size of the electrode surface active material.

This report studies the global Supercapacitor Separator Paper production, demand, key manufacturers, and key regions.
