Abstracts

The global Superconducting Cables market size is expected to reach \$ 350 million by 2032, rising at a market growth of 68.6% CAGR during the forecast period (2026-2032).

Superconducting power cables act as a bridge between electric energy transmission and distribution. In a superconducting power cable, a superconducting conductor that reaches superconductivity of zero electric resistance below a specific low temperature is used, allowing low-loss transmission of large currents. Superconducting cables with just 20 percent of the thickness of copper cables have an advantage of heightening electric power transmission dimensions a maximum of 10 times (5 times in alternating current, 10 times in direct current) compared to previous cables by using the superconducting phenomenon that electric resistance disappears at -196°. This means that there is hardly any dissipation of electricity during power transmission. At present, many national research institutions and cable manufacturers are researching and developing this product. The cable market will completely switch to superconducting cables in the future. Many governments are supporting businesses for the commercialization because of the enormous cost of the project.

Global key player of Superconducting Cables include Nexans. The top player hold a share about 100%. Europe is the largest market, and has a share about 100%. In terms of product type, YBCO Cables is the largest segment, occupied for a share of 100%. In terms of application, Grid and Smart Grid is the largest field with a share about 100 percent.
