According to our (Global Info Research) latest study, the global Superconducting Magnets market size was valued at USD 3275 million in 2023 and is forecast to a readjusted size of USD 3764.5 million by 2030 with a CAGR of 2.0% during review period.

A superconducting magnet is an electromagnet made from coils of superconducting wire. They must be cooled to cryogenic temperatures during operation. In its superconducting state the wire has no electrical resistance and therefore can conduct much larger electric currents than ordinary wire, creating intense magnetic fields. Superconducting magnets can produce greater magnetic fields than all but the strongest non-superconducting electromagnets and can be cheaper to operate because no energy is dissipated as heat in the windings. They are used in MRI machines in hospitals, and in scientific equipment such as NMR spectrometers, mass spectrometers, fusion reactors and particle accelerators.

The global market for superconducting magnets is predicted to witness a progressive growth in the next few years. The growing demand from the medical devices market is one of the key factors that are likely to encourage the growth of the market in the next few years.
