## Abstracts

According to our (Global Info Research) latest study, the global Supplementary Heater market size was valued at US\$ 1806 million in 2025 and is forecast to a readjusted size of US\$ 2431 million by 2032 with a CAGR of 4.4% during review period.

A supplementary heater is a heating device used in industrial processes, energy systems, or air/gas handling systems to provide additional heat, compensate for insufficient main heating systems, and maintain stable process temperatures. It typically works in conjunction with the main system (such as boilers, HRSGs, air heaters, and combustion systems) to provide supplemental heating during load fluctuations, low-temperature startups, extreme climates, or changes in process requirements. The main problems that supplementary heaters address include: insufficient heat from the main system, efficiency degradation due to low temperatures, non-compliance with emission standards, unstable process temperatures, difficulties in equipment startup, and insulation requirements under extreme climates. Supplementary heaters enable industrial systems to maintain a stable, controllable, and efficient temperature supply under any load and climatic conditions. The average price of this product is approximately US\$55,000 per unit, with global sales of approximately 32,000 units.
