## Abstracts

The global Supplementary Heater market size is expected to reach \$ 2431 million by 2032, rising at a market growth of 4.4% CAGR during the forecast period (2026-2032).

A supplementary heater is a heating device used in industrial processes, energy systems, or air/gas handling systems to provide additional heat, compensate for insufficient main heating systems, and maintain stable process temperatures. It typically works in conjunction with the main system (such as boilers, HRSGs, air heaters, and combustion systems) to provide supplemental heating during load fluctuations, low-temperature startups, extreme climates, or changes in process requirements. The main problems that supplementary heaters address include: insufficient heat from the main system, efficiency degradation due to low temperatures, non-compliance with emission standards, unstable process temperatures, difficulties in equipment startup, and insulation requirements under extreme climates. Supplementary heaters enable industrial systems to maintain a stable, controllable, and efficient temperature supply under any load and climatic conditions. The average price of this product is approximately US\$55,000 per unit, with global sales of approximately 32,000 units.

This report studies the global Supplementary Heater production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Supplementary Heater and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2025 as the base year.
