Abstracts

According to our (Global Info Research) latest study, the global Supported Nickel Catalyst market size was valued at US\$ 519 million in 2025 and is forecast to a readjusted size of US\$ 678 million by 2032 with a CAGR of 3.9% during review period.

Supported nickel catalysts are industrial catalysts with metallic nickel (Ni) as the active center, distributed on the surface of a support material (such as diatomaceous earth, alumina, or silica) through impregnation or precipitation methods. They are commonly used in hydrogenation processes such as oil and fat hydrogenation, petroleum resin hydrogenation, and organic synthesis. They offer advantages over Raney nickel (skeletal nickel) catalysts, including greater safety, more uniform dispersion, more stable activity, and better wear resistance.

The upstream supply chain mainly consists of nickel salt raw materials (such as nickel sulfate and nickel nitrate) and support materials (such as alumina, silica, molecular sieves, and activated carbon). Nickel prices are significantly affected by fluctuations in global mineral supply and demand for new energy batteries. The physical properties of the carrier material (pore size, specific surface area) directly determine the quality of the subsequent loading process.

Global sales in 2025 are projected to be approximately 23,895 tons, with an average market price of approximately US\$21,100 per ton. The industry's gross profit margin is expected to be in the range of 30%–45%.
