According to our (Global Info Research) latest study, the global Surface Defect Inspection Equipment market size was valued at USD 1214.2 million in 2022 and is forecast to a readjusted size of USD 2023.5 million by 2029 with a CAGR of 7.6% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Customers of today's consumer electronic devices expect flawless products right out of the box. Scratches, dents, smudges, and other imperfections can lead to costly returns and can damage your brand's reputation and future business. At the same time, reflective surfaces are often very sensitive, which is a challenge for optical metrology. Manual inspections are tedious, expensive, and ultimately always subject to subjective decision-making criteria. During production, wrong painting or coating processes lead to high scrap rates. Defects that go undetected even during final inspection can lead to costly complaints and, in worst cases, loss of customers. Only efficient, automated surface inspection can achieve the highest quality at an acceptable cost. With comprehensive expertise in measurement technology, robotics and automation, surface defect inspection equipment enables you to detect defects in a timely manner and improve product quality in the production cycle.

The surface defect detection equipment condenses a number of advanced technology applications in the field of machine vision, and uses optical principles to detect possible defects on the product surface through image processing and analysis. When there is a defect in the inspected product, the gray value of the image at the defect is different from the gray value of the standard image. By extracting and selecting the features of the defect image, and then comparing the gray value of the defect image with the gray

value of the standard image, it is judged whether the difference exceeds the preset threshold range, thereby judging the detected Whether the product is defective. This is a basic method for surface blemish detection. In the specific detection process, firstly, the CCD industrial camera converts the ingested target into an image signal, transmits it to a dedicated image processing system, and converts it into a digital signal according to the pixel distribution, brightness, color and other information. Then the image system performs various operations on these signals to extract the characteristics of the target, such as: area, length, quantity, position, etc. Output results according to preset tolerances and other conditions, such as: defect, size, angle, offset, number, pass/fail, yes/no, etc.
